

Elements of Position

Overview

Justin Erholtz

12 September 2026

A note. This record indexes the series and is not itself a numbered part. It stays outside the proofs and cites nothing that is not said elsewhere in the series.

Where is 1? Point to it. That question opens the series because the answer is not an object but a closure — a unit that finishes itself while its interior stays endlessly divisible. The first parts of *Elements of Position* build outward from that closure: the midpoint, the inversion pair, the circle that closes as an integer and walks as π , the count that repeats the same unit at every scale. Each step is proved by school-level geometry and algebra. None of it is a new mathematical result, and the series says so wherever it stands on established ground.

What is new is not a theorem. It is the object. Across the founding parts, a single geometric structure is assembled — piece by piece, each piece proved before it is used — until it stands as a rigid, scalable figure: fixed in its internal ratios, indexed by the integers, measurable at any scale without changing its kind. That object is treated with the care a load-bearing structure gets before anything is built on it: tested, named, and only trusted once it holds.

The first parts of this series build that object. What follows does not add to it — it puts it to work.

This work tries to hold two things at once that are often treated as incompatible. The first is respect — for the disciplines it moves through, for the work already done in them, and for minds reaching back into deep antiquity who asked versions of these questions with the tools they had. Nothing here is written to outflank or dismiss that lineage. The second is a refusal to be tidy about it. Where mathematics, physics, architecture, sound, and philosophy touch — and they touch more often, and more strangely, than any one of them is comfortable admitting alone — this series lingers there rather than picking a side and moving on. It does not resolve those overlaps into a narrative for the sake of comfort, and it does not retreat from a question just because it sits at the edge of what one discipline is willing to claim alone.

This lingering is not an invitation to mysticism. There is a peculiar asymmetry in how these questions get received: an ancient writer who names rain as an element is filed under folklore before his argument is read, while a modern equation gets decades of patience regardless of what it has produced, simply for being recent and dense. Neither age nor difficulty is evidence of truth. What is asked here is what is asked of the object itself — that a claim be built from something, and shown, before it is trusted.

The series does not commit to a single open problem, a single field, or a fixed endpoint. It commits to building one object honestly, honoring the history that made the question askable, and staying in the overlaps rather than forcing them shut.

This record is an index. Each part carries its own DOI and can be read independently; this page holds them together and notes where the series stands.

Parts published so far:

- I. *The Closed Unit*
- II. *The Other Walk*
- III. *Meetings*
